

Clinical research study for people with symptoms of the early stages of Alzheimer's disease

TRAILRUNNER-ALZ 1 open label study

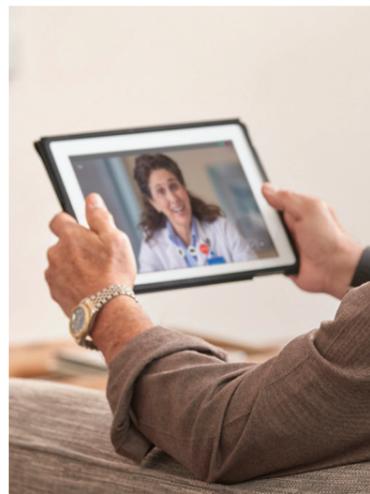

What if I change my mind about taking part in the study?

.....

Taking part in the **TRAILRUNNER-ALZ 1** open label study is your choice. If you decide to take part, you may leave the study at any time for any reason.

Your wellbeing is our biggest concern.
Health checks are a key part of this study.
You will have support from a team of doctors, nurses, and other researchers throughout the research study.

To check if you are able to take part in this study, please fill out the questionnaire on the **TRAILRUNNER-ALZ 1** website at placeholder.com/trialrunner1study.com

Thank you for taking the time to read about and think about joining TRAILRUNNER-ALZ 1 research study.

Have you noticed changes in your memory or ability to think clearly?

.....

If so, you may be able to take part in a clinical research study for people with symptoms of the early stages of Alzheimer's disease.

Help researchers see if we can treat the early stages of Alzheimer's disease.

Early symptoms of Alzheimer's disease include small but clear decline in memory, thinking, language and judgment skills.

What is the TRAILRUNNER-ALZ 1 open label study?

It is a research study to see if an investigational medicine (a medicine being studied) can help treat people with the early stages of Alzheimer's disease.

A **research study**, also known as a clinical trial, helps researchers and doctors to find out if an investigational medicine is both safe and works well.

Open label means you and the study team will know the treatment you will get. In this research study, you will get the investigational medicine.

By taking part in this research study, you can:

- get involved in healthcare for Alzheimer's disease
- help others by advancing medical research

About the TRAILRUNNER-ALZ 1 open label study

Amyloid is a protein that your body makes naturally. In some people, amyloid proteins build up in the brain and form what we call plaques. This may lead to problems with memory and thinking.

Researchers think that removing these amyloid plaques might slow down or delay those problems with memory and thinking.

The **TRAILRUNNER-ALZ 1** open label study will see how safe an investigational medicine is in people with the early stages of Alzheimer's disease. The investigational medicine may remove amyloid plaques.

The study will have about 400 participants in the United States.

Can I join this study?

Yes, you may be able to join the research study if you:

- Are aged 60 to 85 years old
- Have memory loss that has gotten worse over time
- Have a trusted study partner

A **study partner** is a person who knows you well and would notice any changes in your health. This could be your spouse, partner, friend, family member or someone whose job it is to help you. Your study partner would also consent to the research study.

What is involved in the study?

You will receive the investigational medicine as an infusion (slowly drips the medicine through a tiny tube directly into your vein).
